

ABSTRACT

A content-progress indicator for an EPG is described. In an implementation, a user interface (UI) for output by a client and for display by a display device includes a plurality of representation of content items and at least one pictorial representation. Each representation of a content item is selectable by a user to navigate to a corresponding content item. Each content item has a duration when streamed for output by the client. The at least one pictorial representation corresponds to a respective content item and indicates a time remaining in the duration of the respective content item.
